

**Welcome!**

# **Industry Technology and Innovation Summit**

**February 28, 2024**

# Agenda

## Industry Technology and Innovation Summit February 28, 2024

9 a.m.

### Welcome, Overview

- Impact Arizona
- STC Updates
- New STC: Sustainable Innovation

9:35 a.m.

### Guest Speakers

Air Force Research Lab

- Andrew Hamilton

10:00 a.m.

### STC Project Showcases

- AMPED - Jerry Lin
- MADE - Michael Kozicki

10:30 a.m.

### break

10:45 a.m.

### STC Breakout sessions

- 3 STCs, 9 Thrust options

11:55 a.m.

### Highlights and Next Steps

12:00 p.m.

### Poster session and optional networking lunch

## STC introductions

# Kyle Squires

Senior Vice Provost, Dean and Professor at  
Ira A. Fulton Schools of Engineering at Arizona State University

**Arizona State University**

An aerial photograph of a city skyline, likely Phoenix, Arizona, featuring various high-rise buildings and a prominent mountain range in the background under a hazy, orange-tinted sky. The text 'Impact Arizona' is overlaid in a white box in the center.

# Impact Arizona

# Transformational opportunities

Focusing on areas of growth at the intersections of *unique capabilities* and *impacts*

Transformational opportunities require partnerships across an ecosystem

Experience to date – NEI - Impact Arizona, Chips Act, DOE EPIXC Institute, Water Innovation Initiative, NSF Regional Innovation Engine: “NSF Southwest

Sustainability Innovation Engine”, others – demonstrates that **major impact opportunities requires coordination** of federal, state, philanthropic and corporate partnerships

Focused connections on impact characterized by the following:

## Building unique capabilities

### Leveraging expertise

- Faculty
- Centers and facilities
- Industry partnerships

### Corporate partnership

- Seed projects (STC's)
- Comprehensive connections (workforce, research, translation)

### Coordinated Federal and State investment

# Creating Impact for Arizona's new economy

## Creation of high-value jobs

- Technology startups with AZ founders and innovators
- Applied learning opportunities for students, internships and a pathway to high wage jobs
- Partnerships with established AZ technology companies

## Workforce training

- Hands-on research experience produces thought leaders
- Entrepreneurial training paves way from lab to captured value
- Reskilling and upskilling opportunities to enhance and adapt current workforce to cutting edge technologies and innovations

## Attraction and retention of leading corporations

- People, facilities, intellectual leadership
- Partnerships and acquisition opportunities for established companies
- Access to the largest diverse technical talent pool in the nation
- Multiplier opportunities for joint projects and next stage technological development

Talent ... Research ... Translation ... Partnership

# Building Arizona's Impact on the new economy

## ASU's Assignment

### What does it do?

**Accelerates** talent and skills development

**Advances** innovation that drives industrial growth by leveraging Arizona's public universities

**Strengthens** Arizona as a economic leader

### How does it do it?

#### **Workforce development**

New graduates, re-training and upskilling for existing workforce

#### **Science and Technology Centers**

Catalyze industry-relevant research, development and manufacturing

#### **Support for new economy enterprises**

Multiple ASU units partnering with enterprise and supporting entrepreneurship

The background image shows a large, dimly lit room, likely a laboratory or industrial facility. The ceiling is high with a grid of recessed fluorescent lights. In the foreground and middle ground, there are several metal carts with wheels, some containing equipment. In the background, there are large pieces of machinery, possibly scientific instruments or industrial equipment, and a person is visible in the distance. The overall atmosphere is technical and professional.

# **Investing in Science and Technology**

# Summary of an STC

## **Vision:**

**Engine driving AZ innovation, value creation, a skilled workforce and job growth**

## **Key elements:**

- State-of-the-art facilities provide research, development and prototyping capabilities.
- Student and employee training, upskilling and workforce development.
- Entrepreneur programs, tech-transfer focus.
- Industry-academia consortium defines needs and opportunities.
- Matching for industry-funded projects.

# STCs shape Arizona new economy industries

## Advanced Materials, Processes, and Energy Devices (AMPED)

The **AMPED STC** seeks to create the materials and devices needed for broad electrification of the energy sector, with three thrust areas: **photovoltaics, batteries, and power-electronic devices.**

## Manufacturing, Automation and Data Engineering (MADE)

The **MADE STC** seeks to create foundational manufacturing technologies and methods that enable new products and enhancing competitiveness, with three thrust areas: **process science and engineering, robotics and automation, and data analytics, cyber, and AI.**

## Human Performance (PERFORM)

The **PERFORM STC** develops novel technologies to enhance physical and cognitive performance and improve medical prevention and interventions with three thrust areas: **devices, assessment and performance multipliers.**

## Advanced Communications Technologies (ACT)

The **ACT STC** drives innovation and reduce barriers to progress in emerging wireless communications and sensing systems with four thrust areas: **future RF systems, communication for augmented reality, flexible modem SoCs and awareness for autonomous vehicles.**

## Extreme Environments (EXTREME)

The **Extreme STC** addresses challenges of growing population centers by engineering resiliency into airborne emissions, water systems and urban heat-island impacts through innovations in monitoring, processes and materials with three thrust areas: **air, water and heat**

## Sustainability Innovation (SI STC)

The **SI STC** facilitates collaborative development and deployment of innovative sustainability, circularity and net zero solutions for public and private stakeholders with three thrust areas: **insight, foresight, and action.**

# What an STC **is**

- **Consortium** of researchers, entrepreneurs, subject matter experts and technologists in industry
- **Advanced training and development tools** and methodologies that are developed at scale
- Research, development, and prototyping facilities with **state-of-the-art equipment**
- **Embodied expertise** focused on engineering, technology, and commercialization
- Convergence of stakeholders to develop a **growing and highly skilled workforce** to support research & innovation, economic development and state competitiveness

# What an STC **does**

- **Engages industry** to develop a technology roadmap and identify opportunities
- **Solicits and co-funds** (with industry) **proposals** in response to identified opportunities
- Invests in and conducts **research and development** to understand and solve problems
- **Builds capacity by training** the present and future workforce with relevant curricula at scale
- **Transfers learning** to practice through entrepreneurship and industry partnerships
- **Translates projects to industry** to make products and systems that employ areas of strength for the region and ASU

# Seeding Comprehensive Partnerships

## ASU - Applied Materials Center

\$270M partnership, supported by Applied Materials, ASU, and ACA

Brings a suite a 300 mm deposition, etch, and metrology tools to ASU's MTW facility

Capabilities (tools + expertise) are available to *all innovators* on a pay-per-use basis

Arizona Impact

## ASU, Applied Materials to create Materials-to-Fab Center at ASU Research Park

July 11, 2023

More than \$270M in corporate, state investment will help advance Arizona's semiconductor industry

# Example of strategic differentiation

**MTW:** A fab an order of magnitude larger than other schools'; the scale for prototyping at the 200- and 300-mm scales

**Corporate partners:**  
The semiconductor boom in the Valley means we are the go-to university for companies of all sizes

**Our size:** The largest engineering school in the country for producing the talent and innovation needed by our industry partners

**A timely seed:** State investment enabled seed funding to start *doing now* while others remain on the sidelines

## Energy and Materials S

Advances partner training, and research development in battery and electrical technologies.

## Advanced Manufacturing STC

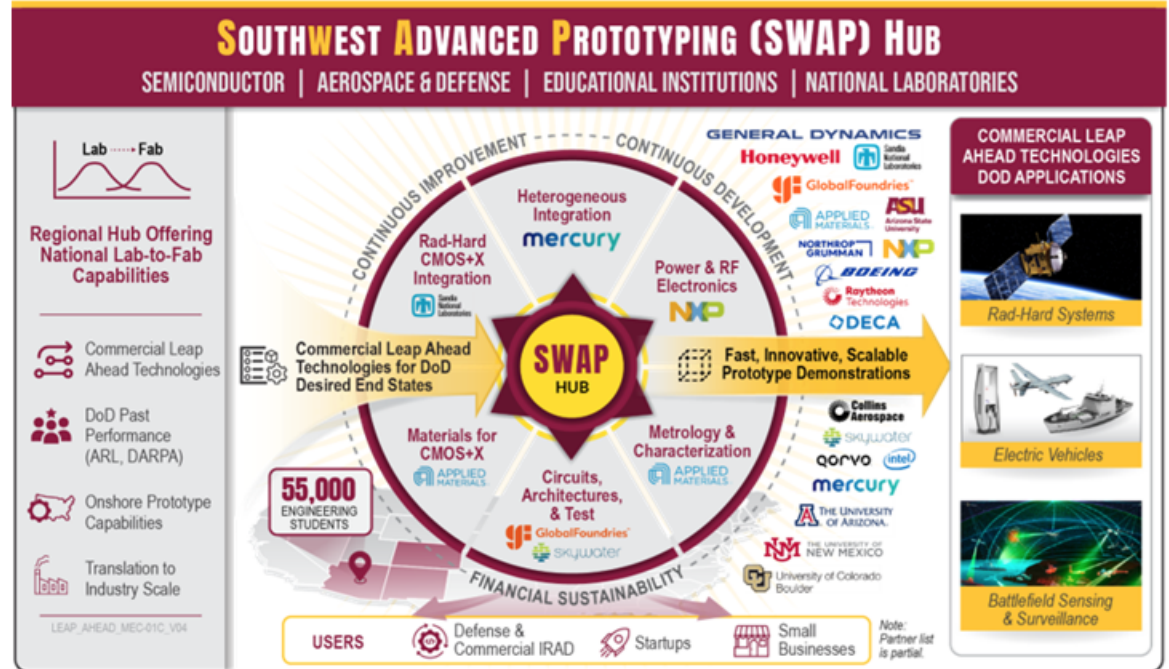

Transforms manufacturing through 3D printing, robotics and automation, and new materials with an emphasis on aerospace, defense and space systems.

# DoD Microelectronics Commons – ASU's winning bid

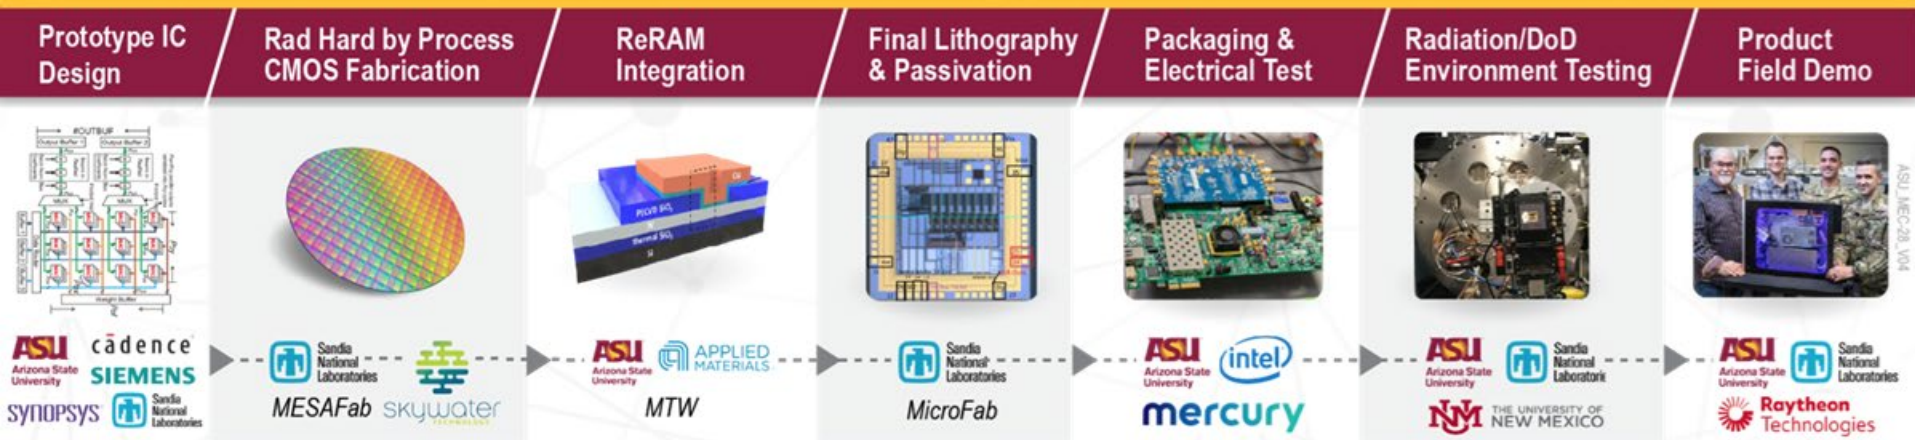

## Enabling the Southwest Advanced Prototyping Hub

ASU and State investment in equipment and team for a ~\$150M proposal to DoD for an ASU-led microelectronics prototyping regional hub

- More than 60 regional and national partners
- 16 FSE faculty part of the proposal submission (6 of whom hired during the past two years)

# SWAP Hub Example Process Flow

## Next steps:

- Signed contract between ASU and NSTXL
- NSTXL hosts first Microelectronics Commons Annual Meeting next week
- Call for proposals released by NSTXL; Hub members can apply for projects

# Big picture...what does success look like?

## Accelerating research

STCs focus on use-inspired research leveraging existing capabilities

STCs seed future research and **comprehensive partnerships** — MURI, ERC, federal joint opportunities

## Translation and talent pipeline

Academia and industry partners collaborate to train a talented workforce

STCs help create start-ups, jobs and provide industry with **upskilling and reskilling** solutions for the present and future workforce

STAM CENTER PRESENTS  
**2023  
MEWD  
WORKSHOP**  
MICROELECTRONICS EDUCATION &  
WORKFORCE DEVELOPMENT

**MICROELECTRONICS**  
SUPPLY CHAIN SECURITY

**TEAM FORMING**  
ADVANCE U.S. MICROELECTRONICS

**MACROTECH WORKS**  
OPEN HOUSE

**NETWORKING**  
BREAKFAST, LUNCH, & DINNER

**JANUARY 24 & 25**

**VENUE**

ASU TEMPE CAMPUS

**UNIVERSITY CLUB**

425 E UNIVERSITY DR. TEMPE, AZ

**KEYNOTE SPEAKER**

DR. DEV SHENOY  
PRINCIPAL DIRECTOR  
FOR MICROELECTRONICS  
AT OFFICE OF THE  
UNDERSECRETARY OF  
DEFENSE OUSD(R&E)  
& DIRECTOR OF THE  
DEFENSE  
MICROELECTRONICS  
CROSS FUNCTIONAL  
TEAM (DMCFT)

## Catalyzing the future

Creating a thriving and robust Arizona economy

STCs advance the Arizona we **want** — skilled and educated workforce and opportunities

**ASU** Southwest Advanced  
Prototyping Hub  
Arizona State University

NSF Engines:  
**Southwest Sustainability  
Innovation Engine**

A dimly lit laboratory or cleanroom with various scientific equipment and carts. The room features a grid ceiling with recessed lighting and a tiled floor. In the foreground, there are several metal carts with wheels, some containing equipment. In the background, there are large pieces of machinery, possibly X-ray diffractometers or similar instruments, and a person is visible in the distance. The overall atmosphere is professional and technical.

# Science and Technology Centers

# AMPED

Advanced Materials, Processes and Energy Devices

Science and Technology Center

## Zachary Holman

AMPED STC Director

Vice Dean for Research and Innovation,

Ira A. Fulton Schools of Engineering

Professor,

School of Electrical, Computer and Energy Engineering

**AMPED**

# Advanced Materials, Processes and Energy Devices

**Science and Technology Center**

## Vision

Create the materials and devices needed for broad electrification of the energy sector.

**AMPED**

# Advanced Materials, Processes and Energy Devices

## Science and Technology Center

### 3 R&D thrusts

#### Solar

#### Batteries

#### Power Electronics

# ARIZONA INNOVATION CHALLENGE AWARDEES

## AWARDEES

The ACA is committed to advancing companies from startup status to market domination. Previous awardees are disrupting the financial aid process for college students, creating more effective ways of fighting brain cancer, pioneering a new frontier at the edge of space in leading the way in the emerging stratosphere economy. And that's just the tip of the iceberg!

2023 Awardees

**ALGOFACE**  
IT - Software  
Carefree, AZ

**DX4LIVER INC.**  
Bio & Life Sciences  
Scottsdale, AZ

**HOMER FARMS INC.**  
Cleantech & Renewable Energy  
Phoenix, AZ

**MACULA VISION SYSTEMS**  
Bio & Life Sciences  
Oro Valley, AZ

**NOBEL WORKS CORP.**  
Cleantech & Renewable Energy  
Tucson, AZ

**OXBYEL TECHNOLOGIES, INC.**  
Cleantech & Renewable Energy  
Phoenix, AZ

**SIMPLIFYANCE**  
Value-Based Compliance  
**SIMPLIFYANCE**  
IT - Software  
Scottsdale, AZ

**SOLSTA BY SOLID STATE NETWORKS**  
IT - Software  
Phoenix, AZ

**SUNFLEX SOLAR**  
Cleantech & Renewable Energy  
Tempe, AZ

**SWIFTCOAT**  
Cleantech & Renewable Energy  
Phoenix, AZ

# Taking batteries 'B-LO Zero'

ASU researcher Nick Rolston is developing solid-state batteries for use in environments with extreme temperatures, such as space

Nick Rolston, an assistant professor of electrical engineering at Arizona State University, is collaborating with researchers from the Swiss Federal Laboratories for Materials Science and Technology, or Empa, to develop batteries that function well in space's harsh temperatures. Photo courtesy Pexels

## Solidifying batteries for space readiness

Rolston is working with a Swiss team led by Moritz H. Futscher, a scientist at Empa and co-founder and CEO of battery startup company [BTRY](#), to develop solid-state batteries for use in space through a project called "Batteries for Low-temperature Operation < 0C," or "B-LO Zero" for short. Solid-state batteries' electrolytes are solids instead of liquids, so they circumvent the risk of freezing or dramatically dropping in performance, like batteries affected by recent winter weather in the United States.

"With all the cold fronts that have hit the U.S., there were some articles I saw about electric vehicles having big issues," Rolston says. "The technology used is liquid-based electrolytes. If it's freezing outside, the batteries may be a little bit warmer than that, but the performance drops dramatically to the point of barely being operable."

A cryogenic chamber will be used in the B-LO Zero project's battery material testing. Photo courtesy Nick Rolston/ASU

# Nidhin Kurian Kalarickal collaborates with industry to develop damage-free manufacturing methods for microelectronics

by TJ Triolo | Jan 18, 2024 | Features, Research

 An electric U-Haul van has its hood open for onlookers to view at an event on the Arizona State University Tempe campus. Nidhin Kurian Kalarickal, an assistant professor of electrical engineering in the Ira A. Fulton Schools of Engineering at ASU, has developed a damage-free

## Collaborating with industry to destroy damage risk

To remedy the damaging methods, Agnitron representatives approached Kalarickal, a faculty member in the [School of Electrical, Computer and Energy Engineering](#), part of the Fulton Schools, and discussed developing a new etching process after ASU purchased a metal-organic chemical vapor deposition, or MOCVD, reactor tool from the company. The tool is used for growing semiconductor material such as gallium oxide.

“Agnitron wanted to engage with my team, and the company’s representatives were quite interested in the idea of investigating in situ etching using metal-organic precursors,” Kalarickal says.

Kalarickal and Agnitron’s method differs from traditional ones in that it uses the same basic metal-organic compound, triethylgallium, that is also used for the growth of gallium oxide in the presence of oxygen. Other methods use a different material that involves damaging energetic plasma.

When gallium oxide is heated and exposed to triethylgallium in the absence of oxygen, gallium oxide undergoes a chemical reaction, resulting in the formation of gallium suboxide. Gallium suboxide is volatile and easily escapes from the sample surface, resulting in etching.

A metal-organic chemical vapor deposition, or MOCVD, reactor from Agnitron used by Nidhin Kurian Kalarickal in his gallium oxide etching research. Photo courtesy of Nidhin Kurian Kalarickal/ASU

# ACT

Advanced Communication Technologies

Science and Technology Center

## Daniel Bliss

ACT STC Director

Professor,

School of Electrical, Computer and Energy Engineering

Director, ASU Center for Wireless Information

Systems and Computational Architecture

# Future Wireless Needs and Desires

- Want faster, more flexible, more available communications
- Want new functionalities that we didn't know we wanted
  - Communications; sensing; positioning, navigation, and timing (PNT); environmental situational awareness; and ?
- Want lower cost, size, weight, and power

## Next Generation Communications

## Autonomous Vehicles

## New Sensing Capabilities

## Augmented Reality

## RF Convergence

## Fully Immersive 3D Interactive Cat Café Simulations

Who knows why,  
but you know  
it'll happen

ACT

# Advanced Communications Technologies

## Science and Technology Center

### Vision

Drive innovation and reduce barriers to progress in emerging wireless communications and sensing systems

Research & development, resources and training

System-driven  
technology needs

Novel system  
concepts and tech

ASU technology  
development

SoC development

SEED FUNDING

Technologies,  
external programs  
and economic  
opportunities

Corporate  
capabilities  
and goals

**Development Example:**  
*Safety Testing Platform  
for Automated Vehicles*

**Training Examples:**

- AI and the joy of life
- AI and Autonomous Driving

**ACT**

# Advanced Communications Technologies

## Science and Technology Center

### 4 R&D areas

Develop new concepts and enabling technologies for critical future applications.

**Future RF Systems**

**Flexible Modem SoCs**

**Communications for  
Augmented Reality**

**Awareness for  
Autonomous Vehicles**

**EXTREME**  
**Science and**  
**Technology Center**

**Kristen  
Parrish**

EXTREME STC Thrust Lead  
Associate Professor,  
**School of Sustainable  
Engineering and the  
Built Environment**

**Paul  
Westerhoff**

EXTREME STC Co-Director  
Fulton Chair of Environmental  
Engineering and Regents  
Professor, **School of Sustainable  
Engineering and the  
Built Environment**

**Matt  
Fraser**

EXTREME STC Co-Director  
Professor,  
**School of Sustainable  
Engineering and the Built  
Environment**

EXTREME

# Extreme Environments

## Science and Technology Center

Our vision is to address challenges of growing population centers by engineering resiliency into airborne emissions, water systems and urban heat-island impacts through innovations in monitoring, processes and materials.

**Air**

**Water**

**Heat**

# Example Water System R&D Topics

Water “quantity” and “quality” needs exist.

Example topics identified by stakeholders include, but are not limited to:

- Processes to provide **new water sources** for people, industry, agriculture
  - e.g., brackish groundwater, wastewater reuse, atmospheric water capture
- **Brine management and zero liquid discharge** from industrial and municipal desalination or hardness treatment processes
- **Sensing and treatment** of emerging chemical and microbial pollutants
  - e.g., PFAS, *legionella pneumophila*, microplastics
- Innovative processes to **reduce/reuse/recapture water** and reduce energy footprint of cooling towers
- Strategies to **monitor, treat and augment groundwater supplies** in urban, rural, mining or agricultural parts of Arizona
- Technologies and processes that enable Fortune 500 companies to **monitor and meet “net zero water” sustainability goals by 2050**

# Example Air R&D Topics

Advancing science-based air quality improvement plans for urban Arizona identified by stakeholders include, but are not limited to:

Example topics identified by stakeholders include, but are not limited to:

- Evaluation of **dust suppression approaches**
  - e.g., enzymatic or biocrust restoration of degraded agricultural land or disturbed surfaces
- Corroboration of **emission inventories**
  - e.g. analysis of current emission inventories used for planning purposes
- Sensing of **industrial air pollutants**
  - e.g., source characterization as well as indoor clean-room studies of volatile organic compounds
- Innovative materials and processes for **emission control**
  - e.g., photocatalytic devices or novel sorbent beds
- Strategies to advance emission offsets through **novel mobile source** control approaches
- Technologies and processes that enable government agencies to **advance clean air equipment deployment**

# Example Heat / Thermal R&D Topics

**Extreme heat is becoming common, and current built infrastructure (buildings, roads etc.) is incapable of managing resulting adverse thermal impacts.**

Example topics identified by stakeholders include, but are not limited to:

- **Outdoor heat impacts workers health** reducing number of hours/days to safely perform construction or other activities
- **Thermal management near, on and within buildings** impact energy demand - novel sensing, materials and building renovation strategies are needed
- **Thermal cracking / failure of pavement and other infrastructure materials reduces infrastructure life require innovations**
  - e.g., cool roofs, building insulation materials with low carbon footprint and high efficiency, cool pavements
- Development and demonstration of **net-zero buildings** (both energy and carbon) is a national priority
- Mitigating heat while **harnessing low/grade or waste heat for beneficial uses** may create win-win solutions

# MADE

Manufacturing, Automation and Data Engineering

Science and Technology Center

## Binil Starly

MADE STC Director

School Director and Professor,  
School of Manufacturing Systems and Networks

**MADE**

# **Manufacturing, Automation and Data Engineering Science and Technology Center**

## **Vision**

Integrate fundamental manufacturing process technologies with advances in automation and data sciences to enhance manufacturing competitiveness.

**MADE**

# **Manufacturing, Automation and Data Engineering Science and Technology Center**

## **3 R&D thrusts**

### **Process Science and Engineering**

### **Robotics and Automation**

### **Data Analytics, Cyber and Artificial Intelligence**

MADE

# Manufacturing, Automation and Data Engineering Science and Technology Center

**Building Thematic  
Capability**

**Autonomous  
Manufacturing in Outer-  
Space Systems**

**Digital Twins  
for Microelectronics  
Manufacturing Systems**

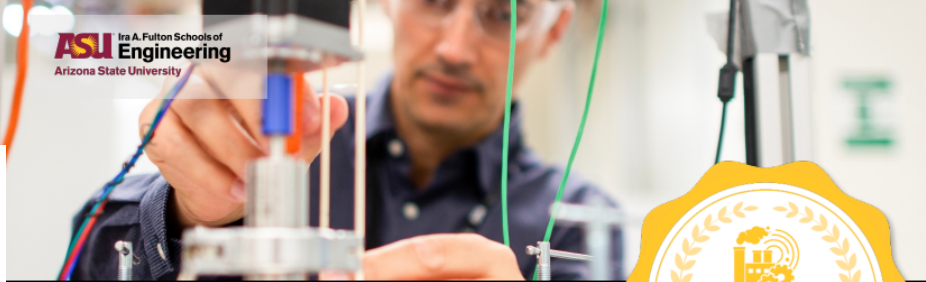

MADE

# Manufacturing, Automation and Data Engineering Science and Technology Center

## Workforce Development

MADE will launch a series of stackable micro-credentials in the theme of Smart Manufacturing, Industrial Robotics, Microelectronics Manufacturing.

**Industrial Internet of Things (IIoT)  
with MQTT Protocol Badge**

The IIoT with MQTT Protocol Badge provide you with the fundamentals of Smart Manufacturing and MQTT communication, preparing you to apply IIoT in the real world!

Designed for engineers, managers, IT Developers, Smart Manufacturing Specialists, and individuals interested in IIoT, learners will focus on Raspberry Pi integration and practical problem-solving.

#### Key Skills Covered

- IIoT Technology Stack Management
- MQTT Protocol Implementation
- Front-End UI Development
- Middleware Deployment
- Smart Manufacturing Integration

-  Live instruction by ASU Faculty Dr. Binil Starly
-  Earn ASU Engineering Badge to showcase your new skills
-  \$499 per micro-badge  
\$1599 for the badge
-  March 15<sup>th</sup> –May 11<sup>th</sup>, 2024

## Marco Santello

PERFORM STC Director

Fulton Professor of Neural Engineering,  
School of Biological and Health Systems Engineering

Senior Global Futures Scientist,  
Global Futures Scientists and Scholars

**PERFORM**

# Human Performance Science and Technology Center

Our vision is to develop novel technologies to enhance physical and cognitive performance and improve medical prevention and interventions.

## Devices

## Assessment

## Performance Multipliers

## **Example Devices R&D Topics**

Biomedical devices.

Wearables.

Sports and leisure equipment.

Performance data analytics.

## **Example Assessment R&D Topics**

Physical/physiological performance.

Cognitive well-being and  
emotional fitness.

Stress assessment.

Resilience and recovery.

## **Example Performance Multipliers R&D Topics**

The relation between humans  
and machines.

Understanding how human-computer  
interfaces/human-robot  
interfaces can enhance  
human performance.

# Tech Hub Strategy Development Award

## Medical Device Manufacturing Multiplier Strategy Development Consortium: Phase 1

The U.S. Department of Commerce's Economic Development Administration awarded the Greater Phoenix Economic Council (GPEC) for a Tech Hubs Strategy Development Award for the proposal *Medical Device Manufacturing Multiplier Strategy Development Consortium Phase 1*. GPEC was one of 29 awardees out of 200 consortia applications. The consortium, which includes Arizona government agencies, universities, colleges and industry, is currently working on a Phase 2 application for spring 2025.

Marco Santello and Sarah Stabenfeldt (SBHSE, ASU) will serve in a leadership role in the MDM2 consortium, and ASU will contribute to lab-to-market strategies by leveraging the expertise of Skysong Innovations, ASU's tech transfer organization.

PERFORM

# Human Performance Science and Technology Center

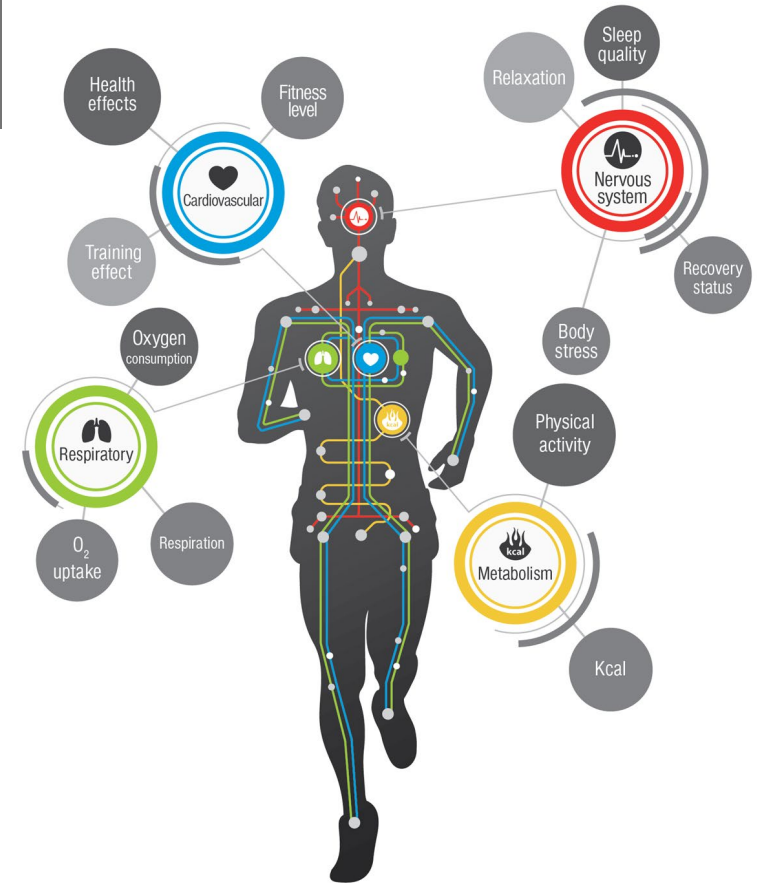

## Workforce Development

### Short Course launched in Fall 2023

Introduction to remote human-centric data collection and processing

Applications for sports, wellness, and healthcare industries:

- Remote human performance data recording
- Basic cloud based data storage and processing
- Data syncing, filtering and restructuring
- Sensor fusion

# Partnerships with industry partners

Movement Interactive / NSF I/UCRC BRAIN

## The Department of Veterans Affairs & Academia

We are pleased to announce that Movement Interactive/NSF BRAIN (ASU), has been awarded **\$23B - 10-year ID/IQ contract** with the **US Department of Veterans Affairs.**

### Few Examples of Existing VA – Academia Relationships

- University Affiliate Program

- Research & Development Programs

- Clinical Trial Programs

- Training & Development Policy Programs

- Innovation & Technology

- Grant Opportunities

# VHA Integrated Critical Staffing Program

**Dr. Eric L. Luster**  
Founder & CEO

**Let's Connect and Collaborate!!**  
[eluster@movement-interactive.com](mailto:eluster@movement-interactive.com)

## **Collaboration between:**

- Veterans Affairs (VA)
- Arizona State University (ASU)
- Movement Interactive, Inc. (MI)

## **ASU gains access to VA contract via NSF Brain / Movement Interactive:**

- Each SDVOSB is Required to Establish a Team of Highly-Qualified Small Businesses, Academia, Non-Profits, and Large Businesses to meet Critical Staffing and Other Requirements – **Veteran Integrated Team (VIT) Model**

Movement Interactive as a Service-Disabled Veteran Owned Business, understands the need for Universities, Research Institutes, and Non-Profit organizations to fulfill the VA mission and be positioned for future task orders, the grant set-asides, and yet-to-be-determined requirements within the VHA ICSP ordering vehicle.

**New STC**

**Sustainability  
Innovation**

**SI**

**Science and  
Technology Center**

## BRINGING IN-SPACE ASSEMBLY AND MANUFACTURING TO THE FOREFRONT OF SPACE INVESTMENT AND DEVELOPMENT

ANDREW HAMILTON

FEBRUARY 28, 2024

# Agenda

Curating the Defense Industrial Base

Myths

Objectives

Theory to Reality

Challenges

## AFRL/RXM – Curating the Defense Industrial Base

### *Uniquely addressing manufacturing & industrial base challenges*

- Across manufacturing development lifecycle
- From process conception through full rate production
- Across the spectrum of aerospace technology
- For acquisition and sustainment

# Manufacturing for Space Systems

*Reduce cost and improve acquisition timelines through manufacturing innovations of advanced technologies for DoD space applications in LEO and beyond.*

- **Proliferated Architectures**

- Operational Resiliency
- More Dynamic Operational Capability
- Rapid Design & Mfg of Optimized Structures
- Lightweight, Scalable Propulsion

- **Commoditization of Advanced Sensors**

- Modular Phased Arrays
- Active Passive Modules

- **Low C-SWAP Environmental Protection**

- Lightweight Radiation Shielding
- Efficient Thermal Management

- **In-Space Servicing, Assembly & Manufacturing**

- Enabling Unlaunchable Subsystems
- Eliminate Launch Mortality
- Extend Operational Lifetime

**STC alignment: ACT** **Development of an Operational Safety Testing Platform for Automated Vehicles**

Science Foundation Arizona  
Prof. Junfeng Zhao, Nithish Kumar Saravanan, Shun-Yen Wang

### Digital Twin & Augmented Reality

**1 Create 3D model**  
A 3D model of the vehicle is created using Blender, an open-source modeling software. Then following a series of steps in Unreal Digital Editor, it is brought into Carla Simulator.

**2 Generate the map**  
The digital scene is generated using the Unreal Digital Editor. The digital scene is generated using the Unreal Digital Editor. The digital scene is generated using the Unreal Digital Editor.

**3 Inject virtual objects**  
Virtual objects are spawned in the Carla Simulator and the message format of these objects are converted to the Autonomy's Perception Stack requirements. Coordinate transformation is done to synchronize the objects to both the Autonomy and Carla.

**4 Localize the Digital Twin**  
This step comprises of localizing the virtual vehicle with the coordinates generated by the AR/VR interface in the real vehicle. The coordinate transformation is done to synchronize the objects to both the Autonomy and Carla.

**5 Sync digital and real vehicle**  
The digital scene is generated in the same way as the real-world vehicle in terms of the accuracy of the localization depends on the accuracy of the map.

### Vehicle Integration

**Vehicle Platform**

- 2022 Mustang Mach-E BEV
- StarCyber Level 2 Automation
- EPA Range 24 Miles
- RSS: 200 cm, 90 km/h
- DC fast charge up to 150 km/h

**Sensor and Actuator**

- DeLorean ERM Module
- Cluster CSI EM Camera
- Local RGB Camera
- Carlini Long Range Radar
- Onix OMS IMU with RTK
- High Performance Control Unit

### Autoware Autonomy Stack

- Autoware is an open-source software stack for self-driving vehicles, built on the Robot Operating System (ROS).
- It includes all of the necessary functions to drive an autonomous vehicle from localization and object detection to route planning and control system with the aim of enabling commercial deployment of autonomous driving in a broad range of vehicles.

### Project Overview

**Project Goal:** To develop an innovative testing platform that can be used for automated vehicles (AVs) operational safety evaluation.

**Expected Impact:** The safety evaluation framework will be published as a standard by SAE International, with the intent to influence regulation from NHTSA. The goal is to enable safe AV development and deployment.

**Project Timeline and Milestones (05/01/2023-07/31/2024):**

Tasks Scheduled (Milestones)	Status
<b>M1: Bench Testing</b>	Completed
<b>M2: Vehicle Implementation</b>	Completed
<b>M3: Cloud Communication</b>	In Progress
<b>M4: System Testing</b>	In Progress

### Cloud Communication

STC alignment: AMPED

### INTRODUCTION

The automotive industry is currently undergoing a paradigm change from conventional internal combustion engine (ICE) vehicles to electric vehicles (EVs). This transition is driven by the need to reduce greenhouse gas emissions and improve energy efficiency. However, the widespread adoption of EVs is hindered by several challenges, including limited driving range, long charging times, and high costs. This research aims to address these challenges by developing an AI-based battery management system (BMS) that optimizes energy utilization and minimizes degradation under extreme operating conditions.

**Research Objectives:**

- Develop an AI-based BMS that maximizes energy utilization and minimizes degradation under extreme operating conditions.
- Validate the AI-based BMS using experimental data and simulation.
- Implement the AI-based BMS on a real-world EV platform.

### DATA COLLECTION METHOD & EXPERIMENTAL SETUP

The experimental setup consists of a battery pack, a BMS, and a data acquisition system. The battery pack is connected to a load, and the BMS monitors the state of charge (SOC), state of health (SOH), and state of power (SOP). The data acquisition system records the battery pack parameters and the load current and voltage. The experimental setup is shown in Figure 1.

**MEB Battery Module: 6.85 kWh**

**Charge/Discharge Profile with Temperature**

### METHODOLOGY

**Unsupervised Learning for outlier detection in battery packs**

- Identify outliers in the battery pack data using unsupervised learning.
- Use clustering algorithms to group similar data points.
- Identify outliers as data points that do not belong to any cluster.

**Semi-supervised Learning for leveraging unlabeled data**

- Use semi-supervised learning to leverage unlabeled data.
- Combine supervised and unsupervised learning.
- Use the supervised learning to learn the underlying structure of the data.
- Use the unsupervised learning to identify outliers and anomalies.

**Self-supervised Learning for large-scale time series data**

- Use self-supervised learning to handle large-scale time series data.
- Use autoencoders to learn the underlying structure of the data.
- Use the learned structure to identify outliers and anomalies.

### CONCLUSIONS

This research has demonstrated that AI-based BMS can significantly improve battery energy utilization and minimize degradation under extreme operating conditions. The AI-based BMS outperforms traditional BMS in terms of energy utilization and degradation. The research findings can be used to develop next-generation BMS for EVs.

**ONGOING/DELIVERABLES**

- Published research articles.
- Developed AI-based BMS software.
- Experimental data and simulation results.

## Plasma Source Modeling of Silicon Nanoparticle Synthesis for Lithium-Ion Battery Anodes

Libi Materials, Inc.  
 Dr. Pavlos Mikelides and Surya Saravajith Rajagopalan

---

**Introduction**

Plasma synthesis of silicon nanoparticles (SNPs) offers the potential for low-cost manufacturing of high-quality SNPs that exhibit Critical-to-Quality (CTQ) features such as narrow particle size distributions and reproducible surface chemistry which are critical to their acceptance as material additives to lithium-ion battery anodes.

Our partner, Libi Materials, Inc. has a pilot system that manufactures high quality SNPs in a plasma source that generates up to 2.5 kg/day of SNPs at a conversion efficiency greater than 95% (Figure 1).

**Figure 1.** Libi Materials SNP synthesis and recovery system (left: Plasma synthesis reactor (right): Plasma synthesis recovery system)

The throughput per unit capital must increase by a factor of 10 to make a significant impact on the adoption of SNPs. Our goal is to utilize established magneto-hydrodynamic material modeling to guide future design towards its objectives.

**Methods**

We utilize OrCAD2D<sup>®</sup> (OrCAD Cad), a 2-D axisymmetric finite-dependent code developed for a multi-component fluid at NASA JPL. The code solves conservation equations for electrons, ions and neutral gas species.

The following governing equations are solved in OrCAD2D:

**Continuity Equation:**  

$$\frac{\partial n_i}{\partial t} + \nabla \cdot (n_i \mathbf{v}_i) = S_i - R_i$$

**Momentum Conservation:**  

$$\frac{\partial}{\partial t} (m_i n_i \mathbf{v}_i) = -\nabla \cdot (m_i n_i \mathbf{v}_i \mathbf{v}_i) + q_i n_i (\mathbf{E} + \mathbf{v}_i \times \mathbf{B}) - \nabla \cdot \mathbf{p}_i$$

**Charge Conservation:**  

$$\nabla \cdot (\mathbf{j}_e + \mathbf{j}_i) = 0 \Rightarrow \nabla \cdot \left( \frac{q_e n_e \mathbf{v}_e}{m_e} + \frac{q_i n_i \mathbf{v}_i}{m_i} \right) = 0$$

**Ohm's Law:  $\mathbf{E} = -\nabla \phi$**

**Energy Conservation:**  

$$\frac{\partial}{\partial t} \left( \frac{3}{2} k_B T_e n_e + n_e U_{e,trans} \right) = \nabla \cdot \left( \frac{5}{2} k_B T_e n_e \mathbf{v}_e + n_e \mathbf{v}_e \frac{3}{2} k_B T_e \right) + \nabla \cdot \left( \frac{5}{2} k_B T_e n_e \mathbf{v}_i + n_i \mathbf{v}_i \frac{3}{2} k_B T_e \right)$$

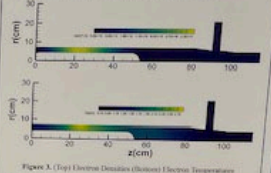

We are upgrading the existing code to simulate the operating conditions of the plasma synthesis reactor. RF plasma excitation will be incorporated to simulate power deposition in the similar region. The model will be validated using experimental data from Langmuir probe measurements. The model will provide insights into optimizing the design such as the tube diameter, position of the RF coil, gas flow rates, and pressures to determine their effects on yield and throughput.

**Figure 2.** Langmuir Probe Assembly

**Results**

Steady state simulations of the actual plasma source device have been completed using argon gas with an inlet flow rate of 5000 SCCM. The device operating at 350W yields a maximum ionization degree of about  $10^{-4}$  which in turn produces charged particle densities of the order of  $10^{17} m^{-3}$ . These particles will interact with Silane molecules to produce the SNPs.

**Figure 3.** (Top) Electron Density (Electron) Electron Temperature

**Impacts**

The market opportunity for advanced anode materials for lithium-ion batteries will exceed \$20B by 2026 while growing at a 19% compounded rate. Libi Materials has the equipment, design and extensive experience manufacturing high vacuum production equipment. We envision a large-scale equipment manufacturing operation in Arizona, leveraging the pool of semiconductor equipment talent in the Phoenix area.

## Rapid State-of-Health Characterization to Measure Battery Degradation for Second Life Applications

Industry Partner: Electric Applications Incorporated  
Selva Seelan Margoschis, Dr. Nicholas Rolston, School of Electrical, Computer, and Energy Engineering  
Ira A. Fulton Schools of Engineering, Arizona State University

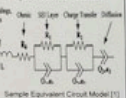

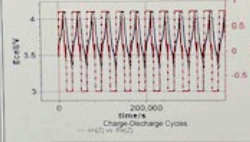

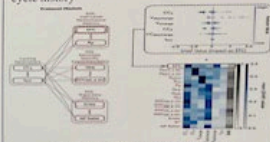

**Introduction:** Arizona has one of the country's fastest growing battery manufacturing sector, featuring prominent OEMs and Tier 1s. With the ongoing expansion of renewable energy sources, there's a rising demand for batteries for stationary storage applications where energy density matters less. Projections suggest that by 2030, second-life lithium-ion battery supply could surpass 200 GWh-hours annually. To tap into this market, rapid methods for assessing battery state-of-health without traditional cycling are needed, especially for larger-scale battery packs.

**Methods:** We are using electrochemical impedance spectroscopy (EIS) to estimate battery SOH. Our approach involves collecting cycling data alongside EIS at various temperatures and charging rates to mimic real-world scenarios. This data integrated with knowledge constraints from equivalent circuit modeling and key elements of battery degradation is used to develop a Machine Learning model to predict the SOH of batteries

**Expected Outcomes and Impacts:** Electric Applications Incorporated is a cutting-edge battery testing facility. The success of this project will result in a SOH prediction model applicable across the \$145 billion battery industry. We can further integrate this model into a Battery Management System (BMS) or develop a standalone tool to predict SOH of batteries without requiring their cycle history

**Next Steps:** We are in the process of characterizing and collecting battery cycling data for a number of Li-ion batteries using a custom test protocol. We are also building the machine learning model and studying the effect of different inputs on state-of-health predictions

Biologic BCS-615 Cycling System    Sample 21700 NMC Batteries    Sample Equivalent Circuit Model (ECM)

Project Objective: To analyze and predict the state-of-health of lithium-ion batteries leveraging advanced evaluation of the electrical and chemo-mechanical processes that contribute to the degradation

## Ohmic Contacts to Nitrogen Doped Nanocarbon Layers for High-Power Diamond Electronics

Mihailat Manahile, Gabriel Munro-Ludders, Eugene Hsu, Franz Koeck, Terry Alford, Robert Nemanich, and Trevor Thornton

**Introduction**

- Diamonds were synthesized and high resolution strength tests is an attractive material for high voltage, high power and high frequency devices. However, existing practical diamond, exhibiting impurity scattering resistance to doping and electrode contacts.
- Research during the wider diamond device space, from the growth and fabrication, including impurity concentrations, has also led to the development of models for diamond contacts. This research contributes to this field by providing a quantitative model for the contact resistance between the top diamond and metal electrode.
- Have developed surface porous nitride and graphene nanolayers enabling better ohmic contact to the diamond surface.
- In this work, a number of porous nitride and graphene based cases (carbon fibers) is used to form a template of porous contact to nitrogen doped diamond (NDD) surface. The model is used to study the relationship between the contact resistance and the porous structure. The model is used to study the relationship between the contact resistance and the porous structure.

**Methodology**

1. Synthesis of porous nitride and graphene based cases (carbon fibers) on NDD surface.

2. Characterization of porous nitride and graphene based cases (carbon fibers) on NDD surface.

3. Fabrication of porous nitride and graphene based cases (carbon fibers) on NDD surface.

4. Characterization of porous nitride and graphene based cases (carbon fibers) on NDD surface.

5. Fabrication of porous nitride and graphene based cases (carbon fibers) on NDD surface.

6. Characterization of porous nitride and graphene based cases (carbon fibers) on NDD surface.

7. Fabrication of porous nitride and graphene based cases (carbon fibers) on NDD surface.

8. Characterization of porous nitride and graphene based cases (carbon fibers) on NDD surface.

9. Fabrication of porous nitride and graphene based cases (carbon fibers) on NDD surface.

10. Characterization of porous nitride and graphene based cases (carbon fibers) on NDD surface.

**Results and Discussion**

NDD, NDD devices showed a high concentration of nitrogen in the NDD layer, which is a key factor for the high conductivity required for semiconductor devices. The high concentration of nitrogen in the NDD enhances the carrier density and consequently the electrical characteristics of the material.

**Conclusions**

The impact of bias applied during NDD growth on the resulting carrier density concentration is studied. A bias voltage of 10 kV at 100 mA was applied on a NDD layer grown under a 1000 Torr and pressure at 700°C, increasing the resulting carrier density to 10<sup>19</sup> cm<sup>-3</sup> and highlighting the carrier role of high bias in the growth.

The results are also compared to the proposed nitrogen concentration model. The model is used to study the relationship between the contact resistance and the porous structure. The model is used to study the relationship between the contact resistance and the porous structure.

**Future Work**

We aim to further the research on a chemo-mechanical model. Subject to thorough characterization and the fabrication of NDD to the end goals.

## Investigation of Water-Borne Epoxy-Modified Acrylic Solar Reflective Base Cool Pavement Coating Technology

**EXTREME STC** **ASU** Ira A. Fulton Schools of Engineering  
Arizona State University

Name of PI : Dr. Jose Medina, Prof. Kamil Kaloush  
Student researchers : Mohammed Alhozaifi, Hasna Elmagri, Jolina Karam

---

### Introduction

Pavement surfaces constitute about 30-40% of total area in urban environments. Roads usually store heat and, along with other factors, contribute to the increase in temperatures in urban areas. It is well known that cool coating technologies increase reflectivity of the paved surface, reflecting solar radiation and reducing surface and pavement temperatures.

### Objectives

- Investigate the durability and the potential service life extension of pavements.
- Determine the frequency of cool coating application to provide the best benefits.
- Determine if epoxy-modified acrylic coating technologies replace conventional pavement surface treatments.
- Estimate the life cycle cost of this technology.

### Materials

Darashield/StreetBond by GAF, is a two-component water borne epoxy modified acrylic coating, for asphalt pavement that helps protect against:

- UV oxidation and water penetration.
- Improves flexibility, adhesion, color stability and chemical resistance.
- Optimize the preservation of asphalt pavements

### Scope or Work and Milestones

Performance Tests & Modeling:

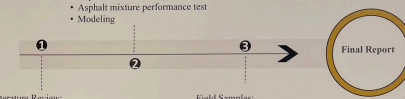

- Asphalt binder rheology
- Asphalt mixture performance test
- Modeling

Literature Review:

- Impact of UV, heat and moisture
- Field performance of asphalt mixtures with cool surface coatings (fines retention, water susceptibility)
- Impact of cool surface coatings on aging
- Aging protocols

Field Samples:

- Field cores
- Asphalt binder and mixture evaluation

---

### Previous Studies & Results

### Expected Outcomes

- The results show that the amount of solar radiation is a key factor in aging. Aging can cause a gradual increase in carbonyl content and thus lead to a decrease in resin light transmittance, given that the carbonyl group absorbs visible light and infrared rays easily. This results in a reduction in reflectivity and cooling value.
- The other study suggests that incorporating RAP millings from pavements treated with cool pavement products does not determine impact. Results from the Indirect Tension Test (ITT) and Hamburg wheel tracking test indicate that these products do not significantly impact the recyclability of asphalt or the potential future use of RAP. They may even provide additional benefits.

## Logic-based Proxy for Simulation in RL Training

Kaustuv Mukherji\*, Devendra Parkar\*, Lahari Pokala, Dyuman Aditya, Paulo Shakarian, Clark Dorman  
\*equal contributions

---

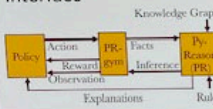

### Motivation

- RL typically requires lengthy training.
- High fidelity simulators (like, AFSIM) are more expensive to train.
- Black box policies are usually opaque and often perverse.
- Model-based simulators are tied to a specific scenario or a specific algorithm.

### Key capabilities

- Open world temporal reasoning.
- Symbolic explainability.
- Modularity.
- Capture non-Markovian dynamics.
- Algorithm agnostic.
- Shielding in reward and environment.

### Interface

### Better RL, Same Algorithm!

**Objective:** Kill enemy or Capture base.

**Model simulator with logical rules**

- Agent(A) can move to square X from Y if X is adjacent and unblocked.
- Invalid move if A tries to move to X, and X is blocked or out-of-bounds.
- If A and bullet(B) are both at X, then A is killed.
- If A is the last survivor, A wins.

**Design rewards using simulator rules**

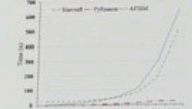

Rule	Reward
I -2 (valid move)	
II -200 (invalid move)	
III +100 (kill enemy), -200 (die)	
IV +250 (win), -250 (lose)	

**Get explainable trace from gameplay**

t	rule	A	B	X
2-7	I	M	-	various
5	II	M	-	center
6	III	G	+	top-left
8	IV	M	-	-

### Scalability

- Three orders-of-magnitude speedup

### Policy Effectiveness

- Deployment of PyReason trained policies in native simulators showed minimal performance variance (~2%).
- Non-Markovian dynamics can help learn intricate and improved policies

Dynamics	Win %	Actions/win
Markov	39	15.51
Non-Markov	83	18.01

### Ongoing Extensions

- Bridging sim-to-real gap in robotics.
- Translating natural language to logic.

**STC-MADE**

## Secure Item-Level Identifiers for IC Packaging

Densec ID, LLC  
Michael Kozicki<sup>1</sup> (PI) and Jesly Joseph<sup>2</sup>

<sup>1</sup> School of Electrical, Computer and Energy Engineering  
<sup>2</sup> School for Engineering of Matter, Transport and Energy

### The problem

Counterfeit ICs cause annual semiconductor industry revenue losses of around \$10 billion and have caused safety-critical systems to fail, resulting in accidents and fatalities.

*"Semiconductor components increasingly require unclonable and tamper resistant identifiers, which are especially necessary as devices become increasingly heterogeneous collections of chiplets and subsystems."*

Anne Meixner, Fingerprinting Chips For Traceability Semiconductor Engineering, December 12, 2023; <https://www.semiconductors.com/fingerprinting-chips-for-traceability/>

### Item-level physical identifiers – fingerprints for things – are a critical enabler for digital identity and supply chain transparency and security.

Natural patterns are used to identify people

Natural patterns can be used to identify things

### Our approach

**Dendritic Identifiers** – high entropy patterns that emerge from Laplacian instabilities in various material systems with a branching, fractal topology

Machine readable keypoints (branching/joining points and terminations) have slightly different geometry and position for every instance of formation – each identifier is naturally unique

Total number of keypoints at generation  $k$  of the dendrite

$$K_k = (S^k)^D$$

- For our dendrites  $S = 2$
- We can resolve to the  $3^{\text{rd}}$  generation,  $k = 3$
- Measured fractal dimension  $D = 1.7$
- So, we obtain 34 robust keypoints
- Taking 2 bits per keypoint (4 equiprobable states) gives  $4^m \cdot 10^{10}$  possible variations

Low structural entropy from rule-based formation leads to simple error correction and robust reading

Identifier material contains micro-scale reflecting elements which produce a unique optical signal that is angle dependent and difficult to fake – gives unclonable identifiers

Patterns read and authenticated via a digital camera system

### Results and ongoing work

Low-cost formation based on the Saffman-Taylor instability in viscous fluids via stamping

Fluid choice is based on use case (removable vs permanent), reflective particles added for security

e.g., acrylic + mica flake (10 to 60  $\mu\text{m}$ ) on back surface of silicon die forms a removable identifier to potentially protect chiplets

Formation models being perfected, e.g., for pattern wavelength  $\lambda$  ( $K_1 = 50$ ,  $\omega = 1$ )

$$\lambda = K_1 \left( \frac{\eta \mu}{\rho \gamma} \right)^{0.3}$$

$\eta$  = fluid viscosity,  $\mu$  = compression force,  $\rho$  = fluid density,  $\gamma$  = capillary length

Fluid thickness  $h_0$  being optimized for mm-scale patterns

- Typical relationship to compression force  $F$  is  $h_0 \sim \sqrt{F}$
- But addition of particles limits  $h_0$  to around 40  $\mu\text{m}$

Identifiers are being directly applied to package parts without surface modification

Stamped Co-based ink – mica flake on integrated test cassette, 6 mm diameter pattern

Stamped Co-based ink – mica flake T-compatible – tested to 240 °C on integrated test cassette, 6 mm diameter pattern

<sup>1</sup> IMPACT Lab  
<sup>2</sup> Mayo Clinic

### Introduction:

Using AI to analyze 12-lead Exercise Stress ECG (ESE) signals can improve CAD risk estimation accuracy. This study integrates AI with clinician expertise to enhance CAD detection from ESE signals, merging clinical risk factors with AI-driven approaches.

Figure 1: Classification overview of CAD detection

### Objective:

Aim to enhance the accuracy of coronary artery disease (CAD) detection by focusing on analyzing 12-lead Exercise Stress ECG (ESE) signals.

Figure 2: Data collection, training, validation, and testing strategy

### Expected Outcomes and Impacts:

Series	Method	CCSA Accuracy	ACC	PPV	NPV	Area Under Curve
Positive	Original gold standard (12-lead ECG)	80.4%	80%	80%	80%	0.80
	Expert-guided CAD detection (AI + Expert)	86.4%	86%	86%	86%	0.86
Negative	Original gold standard (12-lead ECG)	80.4%	80%	80%	80%	0.80
	Expert-guided CAD detection (AI + Expert)	86.4%	86%	86%	86%	0.86

Table 1: Model Performance for Coronary Artery Disease Detection in Test Sets.

- K1 architecture with 5 crucial leads & maximum METs:
  - PPV on unseen test data: 91.2%
  - NPV on unseen test data: 93%
- Expert-guided AI outperforms unguided approach:
  - Average increase in PPV: 12.2%
  - Average increase in NPV: 11.2%

**We achieved a 28% PPV improvement over the current state-of-the-art (92.5%).**

### Next Steps:

Validate with Larger Cohorts: Confirm AI technique's robustness and applicability with larger patient groups.

Independently Test on Diverse Databases: Validate effectiveness across various populations and healthcare settings by testing on diverse databases.

Integrate Ongoing Clinical Expertise: Blend clinical insights to enhance accuracy.

Engage and Scale

### **ASU Lab will conduct research to develop a technique to scale up 2D Zeolites:**

- a) Identifying conditions to scaling up synthesis of 2D plate-shaped zeolites,
- b) Characterizing plate-shaped zeolites synthesized under different conditions
- c) Fabricating LMB coin cells and testing their performance with scaled zeolites
- d) Making large quantity of plate-shaped zeolite for future pouch cell R and D.

ASU Lab will prepare plate-shape zeolites in sufficient quantity to Safe-LiMax LLC on scaling up lithium metal batteries.

# Advanced Materials, Processes and Energy Devices

## Science and Technology Center

### Next Steps

Three methods (KISH, FATE and DHAR) have been studied for synthesis of 2D plate-shaped zeolite crystals

KISH Method

FATE Method

DHAR Method

↑ This method is most promising in terms of zeolite characteristics and scalability

### Milestones:

**1<sup>st</sup> month** – Acquiring a 1-2.5 L autoclave and chemicals,

**5<sup>th</sup> month** – synthesis and structure confirmation of 2D zeolite at scale of 5 g/batch,

**9<sup>th</sup> month** – confirming the electrochemical performance of the LMB cells with the separator made of the new 2D zeolite crystals,

**12<sup>th</sup> month** – synthesis of 200-300 g of 2D zeolites for subsequent LMB pouch cell R and D efforts.

An aerial photograph of a city skyline, likely Phoenix, Arizona, with mountains in the background. The image is overlaid with a semi-transparent dark brown filter. The text is presented in a clean, modern font with a blue and white color scheme.

A person in a red hoodie is working on a drone on a table. The drone is a quadcopter with a camera mounted on the front. In the background, another person in a yellow jacket is visible. The scene is set in a workshop or lab. A yellow and white text box is overlaid on the image.

# Today's Summit

**Process for  
STC projects  
semi-annual cycle**

**FEB**

**APR**

**JUN**

**MAR**

**MAY**

**Projects Begin**  
Collaborative R&D projects  
co-funded by the STC and  
industry partners; 3-6  
projects awarded per STC  
at ~1 PhD student level

# Research project funding

This matrix indicates the fraction of the direct project costs that will be paid for by STC funds; the balance of the direct costs will be paid for by the project industry partner. Both contributions are subject to indirect costs that may depend on the IP terms of the project.

## STC / Stakeholder Partner fractions of project direct costs

**Small for-profit**  
(company and affiliate  
has  $\leq$  500 employees)

**70% / 30%**

**Large for-profit**  
(company and affiliate  
has  $>$  500 employees)

**55% / 45%**

**Non-profit or  
state/local  
government**

**40% / 60%**

# Intellectual property

Intellectual property (“IP”) terms for a given sponsored project are negotiated on a case-by-case basis. The terms may depend on the sponsor’s desired rights, the preferences of ASU faculty and leadership, the nature of the technology and industry, ASU’s investment in the development of the IP, funding sources, applicable law and regulations, and other factors.

To simplify negotiations, below are frameworks that may be available for a sponsored project.

For additional options, please contact ASU research advancement staff.

## Sponsor’s rights; corresponding cost

### No IP Rights

- Available to local/state government agencies and non-profits
- Sponsor has no rights in project IP
- Sponsor pays F&A totaling 57% of direct project costs\*

### Exclusive Option

- Available to for-profit companies
- Time-limited option to negotiate an exclusive royalty-bearing license to project IP
- Sponsor reimburses patent expenses
- Sponsor pays F&A (but no upfront administrative fee), totaling 67.7% of direct project costs\*

### NERF

- Available to for-profit companies
- Non-exclusive, royalty-free license to project IP
- Time-limited option to negotiate an exclusive royalty-bearing license
- Sponsor reimburses patent expenses
- Sponsor pays F&A plus upfront administrative fee, totaling 85% of direct project costs\*

\* Current minimum rate as of January 2022

# Process for STC projects semi-annual cycle

**Funding Opportunity Announcement (FOA)**  
Call for proposals that are responsive to key topical areas within the STC thrusts

FOA written by STC  
Directors and Thrust Leads

**Proposers Review**  
Criteria: Alignment with FOA, likely impact on STC and NEI goals, plan and feasibility, team, industry commitment, appropriate budget

Review panel includes  
STC Director, Thrust Leads,  
industry rep, ASU administration

**FEB**

## ASU ITIS

Industry/ASU discussions of R&D challenges identify key topical areas for STC thrusts

Collaborative R&D projects co-funded by the STC and industry partners; 3-6 projects awarded per STC at ~1 PhD student level

**Research Thrust**  
**Breakout Sessions**

## **Breakout Sessions**

# **Let's agree to**

- 1. Stay on topic.**
- 2. Honor the brisk pace.** (and facilitator)
- 3. Make space for industry voices.**
- 4. Have an exploration mindset.**  
(not problem solving or project pitching)

## Breakout Sessions

# Multimodal Thinking

### Diverge

- No judgement, no limits
- Go for quantity!
- Yes, and...
- Be bold! Anything is possible, What if...

### Converge

- Strategic sorting
- Go for quality!
- Inclusive attitude, look for similarities and affinities

# Breakout Sessions

## Let's explore!

1

**Introductions & Review FOA topics**  
**10-15 m**

**Keep them brief:** Name, role, organization

2

**DIVERGE, individually:**  
**What topics need to be added to the FOA?**  
**Which topics are you interested in pursuing?**  
**5-10 m**

**Diverge:** everyone write your own thoughts (silently)

3

**CONVERGE, together:**  
**Discuss suggestions.**  
**Prioritize the topics and clarify rationale.**  
**25-30 m**

**Converge:** everyone share your suggestions, discuss, prioritize

### Batteries

Lead: Candace Chan

Names/Attendees

**Materials**

- Charging Fun
- In addition to greater battery life should also decrease total weight battery pack for longer, could do more storage based on
- Common materials such as Zn, Fe, etc.
- What does it do? ability to represent the battery system, needed how to flow, long time, common

**Design**

Name: DELVA SERRAO, MAPPING RESEARCH LEAD, MRS. 2.3

RPA/CA SYSTEMS ARE THE HEAVY PARTS OF THE BATTERY PACK, THE BATTERY PACK IS THE BATTERY PACK OF THE BATTERY PACK.

AS ST. PETERS WHO REPAIR BATTERIES, WE ARE IN THE STATE OF ARIZONA, THE BATTERY PACK IS THE HEAVY PART OF THE BATTERY PACK, THE BATTERY PACK IS THE HEAVY PART OF THE BATTERY PACK.

Meeting the demand of the energy storage for the future.

**Manufacturing**

- Battery manufacturing
- Current is a big, big, big improvement.
- Quality & Reliability
  - How to improve the quality, how to improve the quality, how to improve the quality.
- Time Hour
- Cost reduction, lower, better, manufacturing.

**BMS**

- Technology for Life Span extension for Batteries (EV & stationary)
- Can AMPED fund fuel cell technologies?
- What about Green Hydrogen?
- Assembly, student at ASU
- Battery prognostics for EVs
- Predicting RUL/SOH, interacting with the users and suggest practical for more optimal battery use - promoting sustainable use of EV.

**Recycling**

- Battery Recycle (System)
- SC & Batteries (Supply Chain)
- Impact on Global (Material)
- Promoting recycling - Lithium (outside of US)
- More safe panels
- Fire hazards
- Manufacturing waste
- Better working conditions

**AMPED Batteries**

front and back

**BMS**

- Technology for Life Span extension for Batteries (EV & stationary)
- Can AMPED fund fuel cell technologies?
- What about Green Hydrogen?
- Assembly, student at ASU
- Battery prognostics for EVs
- Predicting RUL/SOH, interacting with the users and suggest practical for more optimal battery use - promoting sustainable use of EV.

**Recycling**

- Battery Recycle (System)
- SC & Batteries (Supply Chain)
- Impact on Global (Material)
- Promoting recycling - Lithium (outside of US)
- More safe panels
- Fire hazards
- Manufacturing waste
- Better working conditions

**AMPED Batteries**

## AMPED

### Batteries

Lead: Candace Chan

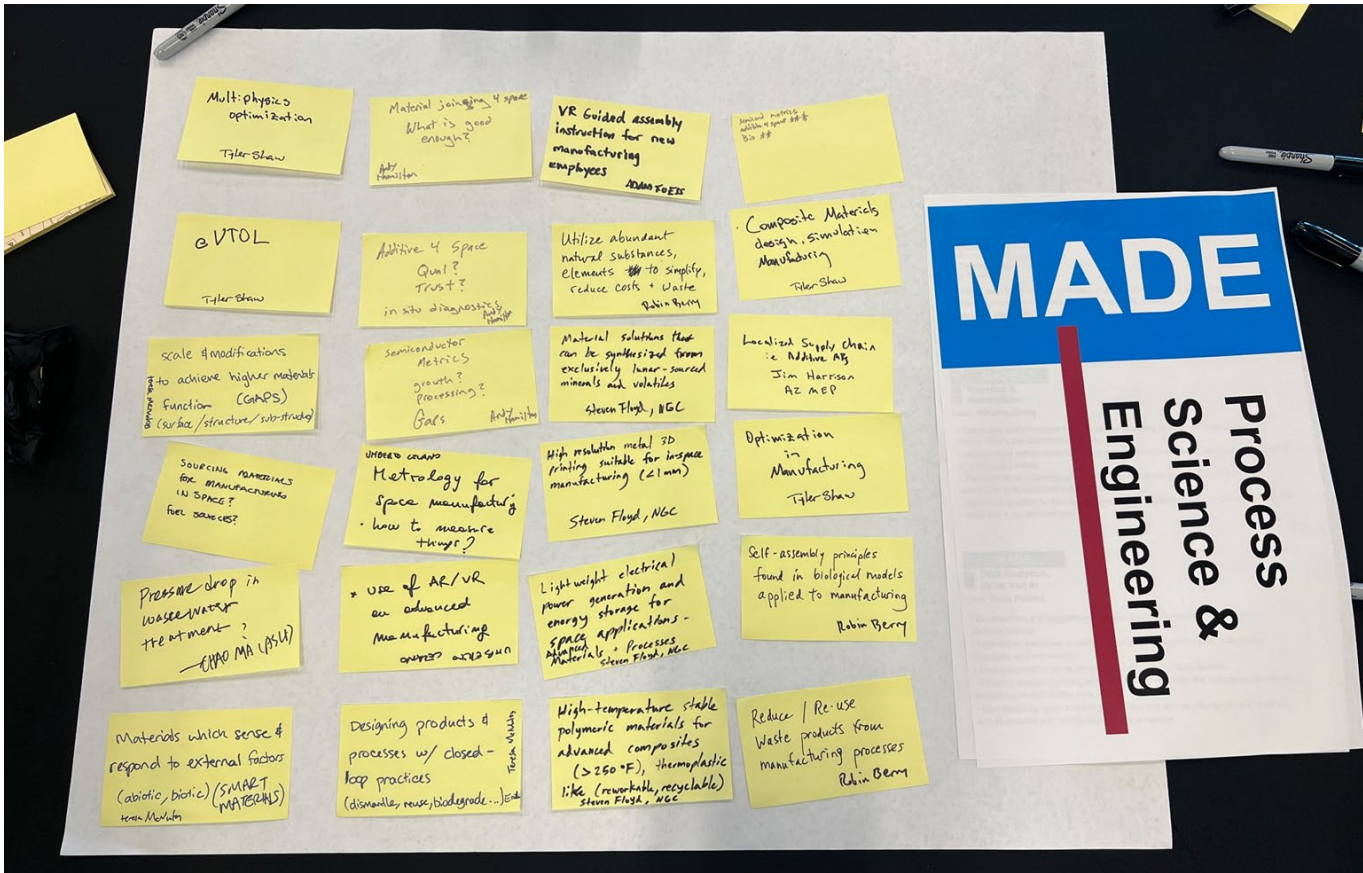

Names/Attendees

- **Materials**
  - Zhaoyang Fan - In addition to power battery we should also develop low cost battery tech for large scale energy storage based on
  - Common materials such as Zn, Fe, etc.
  - Lib does not satisfy the requirements for ESS, new systems are needed
  - New team? long team? company??
- **BMS**
  - Technology for life span extension for batteries (EV & stationary)
  - Can AMPED fund fuel cell technologies
  - What about Green Hydrogen
  - Amulya, student at ASU - Battery prognostics for EVs
  - Predicting RUL/SOM. interacting with the users and suggest practices for optimal battery use - promoting sustainable use of EVs
  - To enhance sustainability, like 1.9M EV batteries were manufactured in the year 2023, this can be reduced when a battery is not abused and is operated in particular conditions
  - Understand degradation
  - to understand the state of discharge using parameters like voltage, current, and temperature of the EV battery
  - This helps us to predict the State of Charge and prompt the user of the range that can be travelled so that the user can plan/change as and when needed
- **Recycling**
  - Battery recycle centers
  - S.C batteries (supply chain)
  - Impact on planet (materials)
  - Working conditions (outside of us)
  - Lithium
  - More solar powered batteries
  - Fire hazards
  - Manufacturing waste
  - Better warranty policies
- **Design**
  - Selva Seelan Margoschis, IS - AR/VR systems are the hottest piece of tech right now, the battery life of apple vision pro is 4-5 hours, so even with much advancements in silicon tech, battery capacity is the major limiter. So need high power density battery/safe battery, maybe SSE Batteries?
  - Meeting the demand for energy or power of different applications
- **Manufacturing**
  - Battery manufacturing using AI and ML based approaches for quality improvement
  - Quality and reliability: How to improve the quality without increasing human's effort? Data collection?? How? What to measure?
  - Yoon Hwa - Cost efficient, greener ?????

[Cynthia Pickering](#)

[Tony Libera](#)

C

AI Knowledge Graph guy from ASU (seated between Tony and Cary)  
AI LMM Comms guy from ASU (seated between Cynthia and Sangram)

### Names/Attendees

Of the five seed topics, topics 1 and 4 were further discussed by the six participants at the table. Topic 5 also surfaced towards the end as related to the other two topic discussions.

1. Development and applications of digital twin for simulation and real-time decision making
2. Data-driven predictive modeling, monitoring, causal analysis, root-cause diagnosis, and visualization
3. Data enhanced material development and design optimization
4. Dynamic system modeling and machine learning with the integration of domain knowledge or with limited data volume
5. Manufacturing cyber security, trustworthiness and regularization of AI method and AI systems with information privacy concerns.

We began with a particular application domain, raised by Cary Tantlinger: using smart phones indoors to find location and based on the indoor location, provide tailored information and alerts. His idea was to use the built in camera(s) and a corpus of images tagged with GPS meta data, along with most recent GPS data from the phone's owner and location of the building with its known geomapping. Use case examples included wayfinding in a Hospital, Finding the way to the room for your meeting in an office building. Important challenges discussed included:

- optimization when data is sparse and bandwidth is low, e.g.
- use in 3rd world countries.
- Multi-modal sensory vision (beyond lidar) especially in busy environments
- Standards for securitizing AI bots
- Intelligent policy and safety handling by AI bots (user intent model)
- Protecting privacy and anonymity of users (so they don't feel like they are under surveillance)
- How many images needed to train the system and provide a quality experience for the current context of the user (Marvin Minsky's law - too many and AI system will provide randomized vs. intelligent response)

SI

## Data and Digital Insight

Lead: Margaret Garcia

Names/Attendees

- Land management parking issue, traffic jam, Emission-Electrification EV Interaction
- MSFT, AZ Autoreporting, Electricity Data Chemical Data center
- Identify drivers of resource use (material, water, energy) and waste production (including emissions)
- Increasing Daily Activity
- Defining individual up to enterprise/community behaviors that can be measured to drive insights and changes for reduced carbon footprints
- Using 1st party data to drive green discounts and improved both outcomes
- User centric solutions
- Training Approach Designed Early in the Process
- User remote sensing to monitor data centers? Heat/humidity monitoring
- Make AI data farms net zero water, carbon, energy
- Using AI to solve key w,e,carbon tech barriers/chemicals
- AI for analysis to collect data governance for external ?????
- Validation of output
- Sustainable -> customer discovery
- Qualitative research
- How many point of use water systems are used, and why are people buying them?
- How can data analytics, Amazon purchases, etc inform the market today
- Will point of use water systems transform water demand like solar pv are?
- How can we avoid use of chemicals in water systems?

### Computational Modeling for Foresight

Lead: Bhavik Bakshi

### Names/Attendees

## SI

### Computational Modeling for Foresight

Lead: Bhavik Bakshi

- Heard this group is the nexus between air and water
- Do we reframe the topic for action-focus!
- red tide algae - bloom (presented at last prop day!) interested in connecting
- GHG reductions see investments
- Water quality/aquatic pollution see fewer investments
- Measuring methane+CO2 emissions+make data available
- Sees SI STC as the group on campus bringing disparate ASU units together!
- data (planet?) observational to detect + measure
- What is the methodology? What are the technical measurements in an aquatic system environment?
- What types of modeling would be relevant? -physics of nano-bubbles, dynamic CO2 CO4 NitOx emissions, biomass evaluation
- Satelites share info where algae blooms are-they rapidly expand
- How can modeling anticipate and act in time?
- Bhavik has contacts in Ohio and FGCU
- Red tide problems are a-political + avoids forcing politicians to admit climate change exists
- Dept of environmental protections requires waste treatment permits + permissions
- Get the right people in the same room?
- Machine learning opportunity
- Marco Janssen - policy, lakes, social sciences, changes in products lowering carbon footprint, decentralize utilities (solar)
- How do we engage w/ utilities? empower the consumer? (human behavior in households interacting w/biophysical systems + decision making)
- Utilities want “big solar farms” but could have ecological impacts and ppl want ecodemocracy to make their own choices
- Household access to clean/potable water
- Can households participate in a decentralized system?
- Water quality as concern?
- Reflection on debates about origins of sources of contaminants
- How does it get measured accurately?
- Bridge between action/intervention and policy/predictions
- Utilities(power) asset is the transmission line (less so the power itself)
- Comp. modeling for aquatics
- Timing,validation of data is challenging
- What are innovative methods using predictive/hybrid sims + models
- Hybrid
- Collaborative
- Intentionally combining expertise to bisect problems
- More organization engagement, more cross-enterprise engagement, more corporate engagement
- Will net-zero + water access differentiate the SW.
- Stakeholders: ag, farming water use cattle pollution, UofA land grant for ag
- Early detection technology
- Transparency into what resources are available at ASU in consolidated place
- Office hours for researchers to meet w/ companies
- SI STC open door tours, insights into resources at ASU
- FOA to include: policy + governance
- Community risk vs individual risk
- Mining water use, integrated assessment model gives context on how the problems overlap or combine
- Sustainability students + professionals need to learn how/navigate insurance leg,fire,floods,etc.
- Help industry partners scale test beds?
- integrated assessment modeling -peoples different disciplines brought all together + combine assessment strategies + tools
- \*climate change\*

### Action for Sustainability Implementation

Lead: Eusebio Scornavacca

SI

## Action for Sustainability Implementation

Lead: Eusebio Scornavacca

Names/Attendees

### DIVERGE

- Use ASU purchasing power to source sustainable [????] - apparel - force dept. to buy sustainable products - Steven Herper, ASU enterprise Partners Outreach Hub
- Unsustainable food systems depicting soils, nutrient levels, polluting water, engaging nature-inspired and indigenous practices to give value back to land, people
- Limitations of nature-based solutions a. not sufficiently used/deployed . When deployed dont take enough inspiration from how ecosystems function. Ex. just tree planting rather than looking at how to be locally attuned
- Financial systems that dont reward triple bottom line & focusing on profit
- Mindset shift/for or with community orgs. about how to invest in sustainability solutions that would decrease overhead costs and allow them to reallocate money
- Holly Huseman - Coke/Fairelife - manufacturing circularity for containers. Not the 'stuff' thats delivered but the pkg that contains the 'stuff'. incentives for companies to return to the original manufacturer. Ways to reduce waste. These are some of the types of circularity beyond consumer items.
- Methods and incorporation of technologies to minimize RO-concentrate waste, water recovery, zero-liq discharge, precious materials recovery.
- Support (training; writing support; review support) for community orgs. on how to draft ASU-comm \$ proposals for sust. solutions
- Sliding scale \$ or cost-share or corporate support to subsidize innovative sustainability solutions w/ comm orgs/nonprofits
- Holly Huseman: Coca-Cola/fairlife - Standard LCA reporting metrics for the SEC reporting requirements. Circular economy + how we can change consumer ideas/habits to be willing to take sustainable actions i.e. returnable containers to grocery stores
- Data to decisions in achieving SDGs - Leah Gerber
- Identifying data needs for decisions - Leah Gerber
- Mainstreaming Biodiversity in global decision making - Leah Gerber
- Making data + tools available to all, democratizing data for D.M. - Leah Gerber
- Creating/identifying financial incentives for sustainability - Randy Vane, Nurtur
- What is available to me to be more sustainable? Randy, Nurtur
- How to create solutions for diverse stakeholders. Randy Vane, Nurtur
- Green premium vs green discount what does it mean to me? (or my employer) Randy Nurtur
- Zach Venvertloh - GPEC - Battery + critical minerals recycling. Carbon capture + utilization, specifically focused on CO2 utilization techniques ie SAF. Sustainable organization technology coordination software and data processing capabilities, technology to better coordinate shared efforts in sustainability
- Understand what areas decision making in polarized political environment. Help communities come together solve issues.
- Reduce carbon emissions from transportation - Kelly Barr ASU
- ASU Campus' to demonstrate zero carbon - walk the talk demonstration projects
- Measuring biodiversity outcomes for nature based solutions - Colette Pansini, SRP

## SI

### Action for Sustainability Implementation

Lead: Eusebio Scornavacca

### CONVERGE

- Lessen human impact
- Protect environment while fostering growth
- Use data to develop a financially profitable system that recognizes sustainability - Steven Harper ASU EP OH
- Rethink current structures/systems (recycling, circular economy/manufacturing)
- Public engagement, buy-in, mindset shift - how to market to change consumer behavior + corporate profit hunting - access to data
- Whole-system analysis
- Leveraging insights to attract investment
- looking at sustainability as a multifaceted concept
- democratization of data - Hannah Buchanan, SRP
- New financial mechanisms centered in sustainability outcomes
- Nature-based solutions
- Action-oriented partnerships
- Prospective data strategy + applications
- increase participation + action
- Increase diversity of programs and program awareness. Randy, Nurtur
- Nature based solutions|biodiversity co benefits
- water resiliency
- Decarbonization|net zero| leading by example at ASU
- Changing consumer behaviors|perceptions
- Economical solutions
- Widespread voluntary acceptance
- Practical not perfect
- Battery recycling
- circular economy-focus on plastic waste reduction
- Carbon reduction, social community support
- Water recovery from waste and water purification
- Pkg circularity on campus, @ mfg sites, w/ consumers
- Environmental efforts: biodiversity, forests, wholistic, native ideas
- Water sustainability
- Water reuse/recycle
- Water conservation
- New/smart technologies
- Atmospheric water capturing
- Widespread sensor use
- ASU walks the talk (w/ sustainability solutions)
- Circular economy
- Consumer behavior
- Market incentives
- Standardizing data + developing decision tools
- Mitigating impacts of operations - Leah Gerber
- Circularity using ASU as a model while engaging industry + non-profit
- Focusing on value & triple bottom line especially externalities - Social - Environmental
- Aggregating data and making it accessible and open source
